

SAF-T-MATE™

Hinged Safety Platform & Railing

Simple, Safe, Secure Work Platform

Safe-T-Mate is an elevated work platform and safety railing that has been designed to comply with OSHA standards. Each ten-foot section has three support arms and a grip strut walking surface to provide a safe, solid work platform. The safety rail attaches to the platform with a three-point post system that connects and locks the rail in place. The rail is designed to withstand 200 pounds of force in any direction as required by OSHA.

The platform attaches to the side of a girder, beam, or similar steel form with a hinged connection. This connection allows the platform and rail to drop out of the way when not in use. Drop Saf-T-Mate to provide clearance for curing covers. When dropped, the rail can be removed to allow the sideforms to be lifted or moved back when stripping the concrete product from the form.

Saf-T-Mate can be easily retrofitted on existing sideforms, or ordered with new sideforms. Standard ten-foot sections can be installed along the entire length of the sideforms by hand, with no special handling equipment, making it easy to use the platform and rail on multiple forms within the plant.

To install Saf-T-Mate, small channels with pre-welded nuts are welded to the forms' outside gussets. These become a permanent part of the form. Next, steel arms used to attach the platform are bolted to the channels. The railing drops into tubes welded to the platform. Once the rail is attached, the platform is raised and pinned in place. Except for the channels welded to the gussets, the entire system can be moved to another form when changing production lines.

Most companies consider safety their highest priority; and, most companies struggle with finding a well-designed and cost-effective catwalk system. Saf-T-Mate is the answer. It's easy to install, can be used on multiple forms and provides a safe, secure work platform.
